Rust Engineer

pcfaktor@gmail.com • t.me/pcfaktor • github.com/pcfaktor • linkedin.com/in/anton-savich

Rust engineer with 6+ years of software engineering experience designing backend systems, smart contracts, and user-facing applications.

Since 2022, I have been developing blockchain applications alongside my full-time engineering roles while expanding into Rust backend development in 2023. My blockchain experience is centered on the Solana ecosystem and includes payment and escrow systems, NFT minting, cross-chain integrations, smart contract security reviews, and backend API development.

Experience

Founding Rust Engineer – [Dropsome](#) (Self-funded) Dec 2024 – Present

Self-funded Solana application enabling SOL transfers to recipients without an existing wallet using secure magic links.

- Architected the system spanning the Solana program, backend services, web application, and deployment infrastructure.
- Designed the account model and implemented an Anchor program using PDA-based vault and record accounts to support escrow, claim, and refund workflows.
- Implemented account initialization, closure, authority validation, and rent management, ensuring secure fund recovery for senders and authorized claims by recipients.
- Designed a non-custodial onboarding flow using per-drop wallets, encrypted wallet recovery phrases, and stateless backend services without persisting user keys.
- Built backend APIs for transaction construction, encrypted claim links, wallet import, and refund management.
- Developed frontend flows for wallet connectivity, on-chain transactions, claim workflows, and account discovery.
- Maintain the application on Solana mainnet with live user transactions.

Tech Stack: Rust • Anchor • Solana • TypeScript • Next.js • Solana Web3.js • Trident • Docker • GitHub Actions • Cloudflare • Vercel

Rust / Solana Engineer – Independent Contractor Feb 2025 – Jul 2025

Startup developing a platform issuing legally registered sports collectibles as real-world assets (RWA) on Solana and Ethereum.

- Led development of the Solana architecture for a dual-chain NFT platform.
- Designed and implemented Anchor programs supporting NFT minting, metadata management, royalties, and ownership transfers.
- Collaborated on the platform architecture, with Solana and Ethereum maintaining independent on-chain logic coordinated through backend services and shared application state.
- Reviewed authority constraints, access control, withdrawal logic, and account validation before mainnet deployment.
- Resolved wallet and explorer compatibility issues encountered during production rollout.

Tech Stack: Rust • Anchor • Solana • Metaplex (Core, Bubblegum, Candy Machine, DAS) • TypeScript • Next.js • Bun • PostgreSQL • Docker • AWS

Software Engineer – SoftTeco Feb 2022 – Feb 2026

International software engineering company delivering enterprise solutions across consumer electronics, healthcare, automotive, and Web3 products.

- Promoted Rust as the backend technology for an enterprise WireGuard VPN solution, designing authentication, user management, and role-based access control services alongside the Android client.
- Designed and implemented a Rust backend for the company's open-source smart home platform, reusing the authentication and RBAC architecture across multiple applications.
- Developed REST APIs using Rocket, PostgreSQL, Redis, Docker, AWS, and GitHub Actions.
- Led Android development of the smart home application, contributing to system architecture, code reviews, and engineering mentoring.
- Designed and implemented Android applications from architecture to release across enterprise, embedded, AI, Web3, and connected-device domains.

Selected Projects

- Smart Home platform (Rust backend & Android application)
- Enterprise WireGuard VPN solution (Rust backend & Android client)
- AI writing assistant (Android & iOS)
- Web3 wallet and gaming client
- VR device configuration suite
- Electric scooter head unit system application

Tech Stack: Rust • Rocket • PostgreSQL • Redis • Docker • AWS • GitHub Actions • Kotlin • Android • Jetpack Compose • Compose Multiplatform • Firebase

Software Engineer – Spark Lab

Mar 2020 – Jan 2022

Research and development company building connected hardware devices and companion mobile applications.

- Developed Android applications communicating with prototype hardware over Wi-Fi.
- Designed firmware update mechanisms supporting rapid hardware iteration during product development.
- Implemented Full HD video streaming with approximately 200 ms playback latency.
- Developed custom communication protocols between embedded devices and Android applications.
- Introduced engineering practices including documentation, design reviews, and coding standards.

Tech Stack: Kotlin • Android • NDK • Coroutines • GStreamer • Firebase

Technical Skills

Rust • TypeScript • Kotlin

Rocket • PostgreSQL • Redis • REST APIs

Solana • Anchor • SPL • Metaplex • UMI

React • Next.js

Docker • AWS • GitHub Actions • Cloudflare • Vercel

Trident • LiteSVM • X-Ray • Radar

Education

Bachelor of Software Engineering, Belarusian National Technical University (2020)

Certifications

Solana Auditors Bootcamp • School of Solana (Seasons 1 & 6) • Building Web APIs with Rust

Community

Mentor – Android Academy Global and The Rolling Scopes School
