Rust Engineer

pcfaktor@gmail.com • t.me/pcfaktor • github.com/pcfaktor • linkedin.com/in/anton-savich

Rust engineer with 6+ years of software engineering experience designing and shipping software systems. Recent work centered on Rust – smart contracts, backend services, and APIs – with end-to-end ownership from architecture and implementation to deployment and maintenance of live systems.

Experience

Rust / Solana Engineer – [Dropsome](#) (Self-funded) Dec 2024 – Present

Self-funded Solana application enabling SOL transfers to recipients without an existing wallet through secure magic links.

- Architected and implemented the full system: Solana program, backend services, web application, and deployment infrastructure
- Designed the account model and built an Anchor program using PDA-based vault and record accounts for escrow, claim, and refund workflows
- Implemented non-custodial onboarding with per-drop wallets, encrypted recovery phrases, and stateless backend services
- Deployed and maintain the application on Solana mainnet with live user transactions

Tech Stack: Rust • Anchor • Solana • TypeScript • Next.js • Docker • GitHub Actions

Rust / Solana Engineer – Contract Feb 2025 – Jul 2025

Startup issuing legally registered sports collectibles as real-world assets (RWA) on Solana and Ethereum.

- Led development of the Solana architecture for the dual-chain NFT platform
- Designed and implemented Anchor programs for NFT minting, metadata management, royalties, and ownership transfers
- Reviewed authority constraints, access control, withdrawal logic, and account validation before mainnet deployment
- Resolved wallet and explorer compatibility issues during production rollout

Tech Stack: Rust • Anchor • Solana • Metaplex • TypeScript • Next.js • PostgreSQL • Docker • AWS

Software Engineer – SoftTeco Feb 2022 – Feb 2026

International software company delivering enterprise solutions across consumer electronics, healthcare, automotive, and Web3.

- Promoted Rust as the backend technology for an enterprise WireGuard VPN solution and designed authentication, user management, and RBAC services
- Designed and implemented a Rust backend for the company's open-source smart home platform, reusing the authentication architecture
- Developed REST APIs using Rocket, PostgreSQL, Redis, Docker, and AWS
- Led Android development of the smart home application, contributing to system architecture, code reviews, and engineering mentoring

Tech Stack: Rust • Rocket • PostgreSQL • Redis • Docker • AWS • Kotlin • Android

Software Engineer – Spark Lab Mar 2020 – Jan 2022

Research and development company building connected hardware devices and companion mobile applications.

- Developed Android applications that communicated with prototype hardware over Wi-Fi
- Designed firmware update mechanisms supporting rapid hardware iteration during product development

- Implemented Full HD video streaming with approximately 200 ms playback latency
- Developed communication protocols between embedded devices and Android applications

Tech Stack: Kotlin • Android • NDK • Coroutines • GStreamer • Firebase

Technical Skills

Rust • TypeScript • Kotlin

Rocket • PostgreSQL • Redis • REST APIs

Solana • Anchor • SPL • Metaplex • UMI

React • Next.js

Docker • AWS • GitHub Actions • Cloudflare • Vercel

Trident • LiteSVM • X-Ray • Radar

Cursor • CLI agents (omp, OpenCode, Copilot CLI) • Agent-assisted workflows

Education

Bachelor of Software Engineering, Belarusian National Technical University (2020)

Certifications

Solana Auditors Bootcamp • School of Solana (Seasons 1 & 6) • Building Web APIs with Rust

Community

Mentor — Android Academy Global and The Rolling Scopes School
